

Dental Issues

At the beginning of the 20th century 95% of all focal infections in the body were shown to have originated in the teeth and tonsils. And the picture hasn't changed much into the 21st century. We now know that dental infections are linked to heart disease, cancer and many signs and symptoms of neurological conditions.

In short, a single unhealthy tooth can cause illness elsewhere in the body. There are many mechanisms for this. Firstly, teeth sockets are a gateway for transporting toxic matter into other bones including the jaw from where it can migrate to other tissues. The cranium is especially vulnerable and disease-causing organisms and toxins can migrate to the brain causing inflammation and myelin loss of the nerve tissues.

Secondly, tooth infections can easily spread to the eyes and sinuses due to proximity.

Thirdly, many oral infections are hidden underneath a cap, bridge or crown, allowing the pathogens to multiply and overwhelm the body's immune system.

Root canals are very often harbouring hidden infections and lead to headaches, fatigue, gut disorders etc.

Amalgam fillings with mercury are of course a major issue for our health as the mercury are breathed in and also leached into our bodies on a daily basis. Mercury is a neurotoxin and can lead to many health issues.

When do you need Dental Testing?

- Any health concern that is not responding to treatment
- Problems in the mouth, teeth, head and neck
- Amalgam fillings or caps on teeth
- Root – filled teeth
- Bridges, crowns or dentures
- Implants
- Extractions
- Infections

How do we address dental issues?

Using specific testing techniques and Bioresonance therapy, we can establish whether a tooth is exerting a pathological interference on the body systems. We measure the voltage of the teeth to determine whether there is a disturbance from abscess, fistula, fractures, inflammation, leakage of materials/metals from the tooth, reaction to dental material or root infections.

Using BICOM Bioresonance and QRA we can minimise the effect of dental work and materials on the body and treat infections and blockages. This will encourage the body to accept and adjust to the changes created by dental work and to eradicate any infections.

We can also assist detoxification of mercury and amalgam through specific Bioresonance therapy, Dental Clay and herbal support.

We offer pre- and post-surgical treatment as well as pre-and post-amalgam removal treatment.

Unfortunately, conventional medicine and dentistry may not be able to detect many of these issues related to the teeth and this is where Bioresonance testing can really make a difference.

If you have any concerns about your dental health or your health in general, make an appointment to find out what the root cause of the problem is.
